

DAC Migration DSS

Digital Automatic Coupling Migration - Decision Support System

DAC Migration DSS is a decision support system that helps plan the large-scale transition from traditional screw couplers to digital automatic couplers in European rail freight. It combines simulation and capacity planning to support a coordinated, efficient and reliable migration process.

DAC Migration DSS PopUpSim brings together key capabilities for simulation-based migration planning and operational decision support:

- Microscopic simulation of wagon conversion processes
- Workshop capacity planning for pop-up retrofit sites
- Statistics and analyses for decision support
- Tracking of individual wagons throughout the workflow
- Linking operational simulation with strategic migration planning
