

Rail Condition Monitoring - Open Source Software

RCM OSS is an Open Source project for railway condition monitoring. It provides the open RCM-DX exchange format and supporting tools to make railway infrastructure diagnostic data accessible, exchangeable and readable over the required retention period.

RCM OSS brings together open formats and tools for working with railway condition monitoring data:

- Open RCM-DX format for exchanging railway infrastructure diagnostic data
- HDF5-based storage structure for measurement data, metadata, topology and positioning information
- Support for multiple diagnostic data types such as 1D signals, 2D profiles, images, videos and events
- Vendor-independent access to diagnostic data without proprietary formats or specialized software
- Long-term readability and storage of condition monitoring data
- Visualization and comparison of measurement runs with the RCM-DX Viewer
